## CONTROL STRUCTURES

### Part 2

# LOOP STRUCTURE IN C: **ITERATION**

CONTROL

STRUCTURES IN C

- It is where a **set of instructions or structures are repeated** in a sequence a specified number of times or until a condition is met.
  - It is also known as **iteration**.
- 
- Used in programming to **execute** a block of code **repeatedly** until a specified condition is met.

# LOOP STRUCTURE IN C: PRETEST LOOPS

## CONTROL STRUCTURES IN C

condition is checked before each repetition to determine if the loop should terminate or continue

# FOR LOOP: DEFINITION

- Executes a sequence of statements multiple times and abbreviates the code that manages the loop variable.

# FOR LOOP: SYNTAX

## CONTROL STRUCTURES IN C

```
for (initialization; test condition; increment/decrement)
{
    /* statements inside the body of loop */
}
```

# FOR LOOP: HOW DOES IT WORK?

- The initialization statement is executed only once.
- Then, the test expression (condition) is evaluated.
  - If the test expression (condition) is evaluated to false, the for loop is terminated.
  - If the test expression (condition) is evaluated to true, statements inside the body of for loop are executed, and the update expression is updated.

CONTROL

STRUCTURES IN C

# FOR LOOP: HOW DOES IT WORK?

- Then, again the test expression (condition) is evaluated.
- The process goes on until the test expression (condition) is false.
  - When the test expression is false, the loop terminates.

# FOR LOOP: FLOWCHART

# FOR LOOP: EXAMPLE

## CONTROL STRUCTURES IN C

```
#include <stdio.h>
```

```
int main ()
```

```
{
```

```
    /* local variable definition */
```

```
    int y;
```

```
/* for loop execution */
```

```
for(y=1; y<15; y++ )
```

```
{
```

```
    printf("The value of y: %d\n", y);
```

```
}
```

```
    return 0;
```

```
}
```

# INFINITE LOOP

## CONTROL STRUCTURES IN C

- It happens when a condition never becomes false.
- The for loop is traditionally used for this purpose.
- Since none of the three expressions that form the 'for' loop are required, you can make an endless loop by leaving the conditional expression empty.

```
#include <stdio.h>
```

```
/* NOTE - You can terminate an infinite loop */
```

```
/* by pressing Ctrl + C keys or Ctrl + Break keys.*/
```

```
int main ()
```

```
{
```

```
    for( ; ; )
```

```
    {
```

```
        printf("This loop will run forever.\n");
```

```
    }
```

```
    return 0;
```

```
}
```

# WHILE: DEFINITION

## CONTROL STRUCTURES IN C

- Repeats a statement or group of statements while a given condition is true.
- Tests the condition before executing the loop body.

# WHILE: SYNTAX

## CONTROL STRUCTURES IN C

```
while (test condition)
{
    /* statements inside the body of the loop */
}
```

# WHILE: HOW DOES IT WORK?

- The **while loop** evaluates the test expression inside the parenthesis ().
- If the test expression is true, statements inside the body of while loop are executed.

# WHILE: HOW DOES IT WORK?

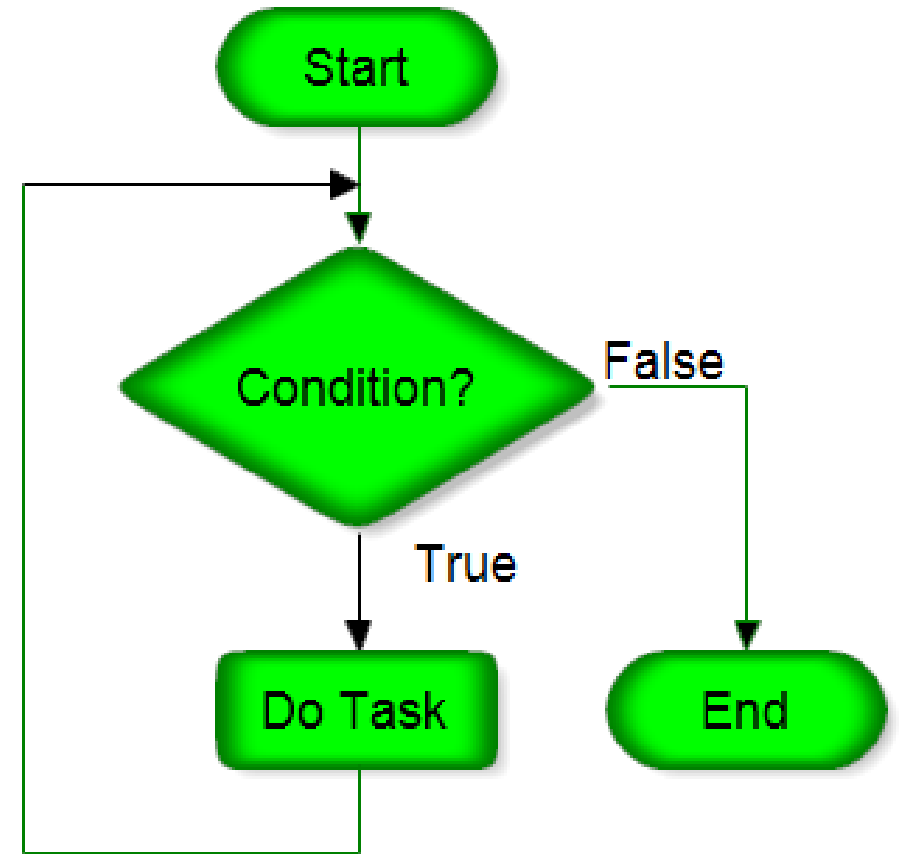

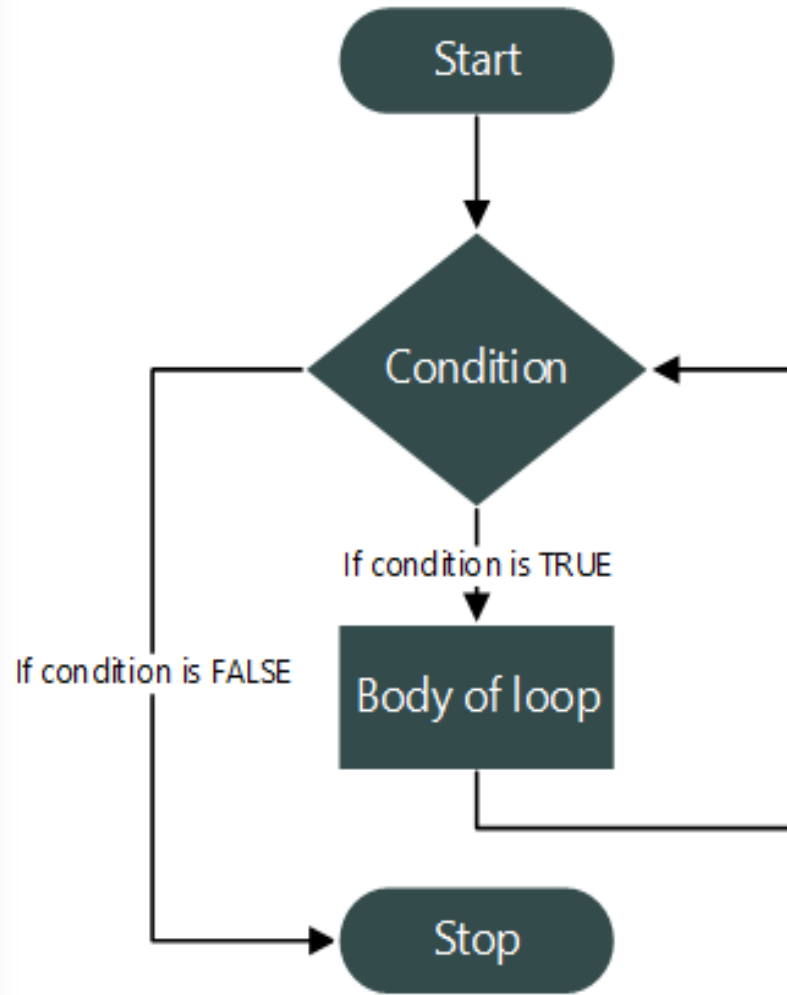

- Then, the test expression is evaluated again.
- The process goes on until the test expression is evaluated to false.
- If the test expression is false, the loop terminates.

# WHILE: FLOWCHART

CONTROL  
STRUCTURES IN C

# WHILE: EXAMPLE

## CONTROL STRUCTURES IN C

```
#include <stdio.h>
```

```
int main ()  
{
```

```
    /* local variable definition */  
    int y = 1;
```

```
    /* while loop execution */  
    while( y < 15 )  
    {  
        printf("The value of y: %d\n", y);  
        y++;  
    }  
  
    return 0;  
}
```

# LOOP STRUCTURE IN C: POSTTEST LOOPS

## CONTROL STRUCTURES IN C

condition is checked after each repetition to determine if loop should terminate or continue

# DO-WHILE: DEFINITION

## CONTROL STRUCTURES IN C

- The **do...while loop** is similar to while loop with one important difference.
- The body of the **do...while loop** is executed at least once.
- Only then, the test expression is evaluated.

# DO-WHILE: SYNTAX

**do**

{

/\* statements inside the body of the loop \*/

} **while** (test condition);

CONTROL

# DO-WHILE: HOW DOES IT WORK?

- The **body** of **do...while loop** is executed at least once and **only then**, the test expression is evaluated.
- If the test expression is **true**, the body of the loop is executed again and the **test expression** is evaluated.

# DO-WHILE: HOW DOES IT WORK?

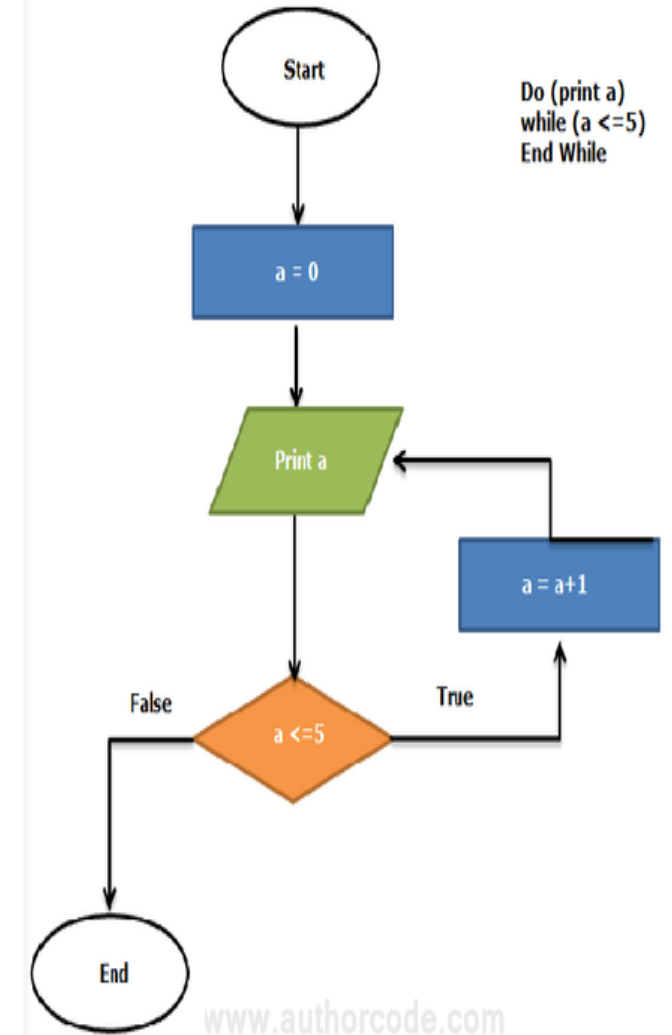

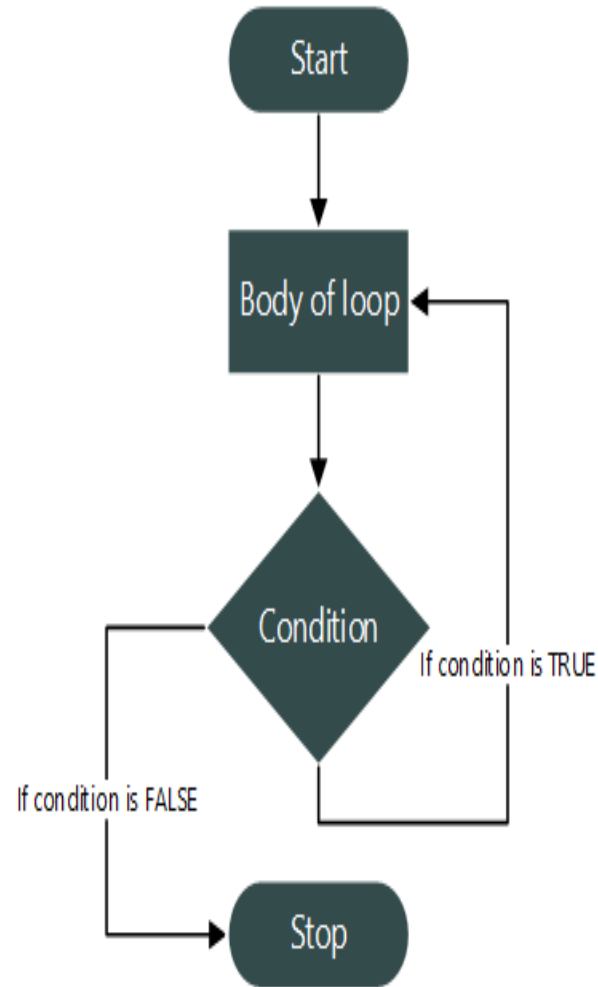

- This process goes on until the test expression becomes false.
- If the test expression is false, the loop ends.

# DO-WHILE: FLOWCHART

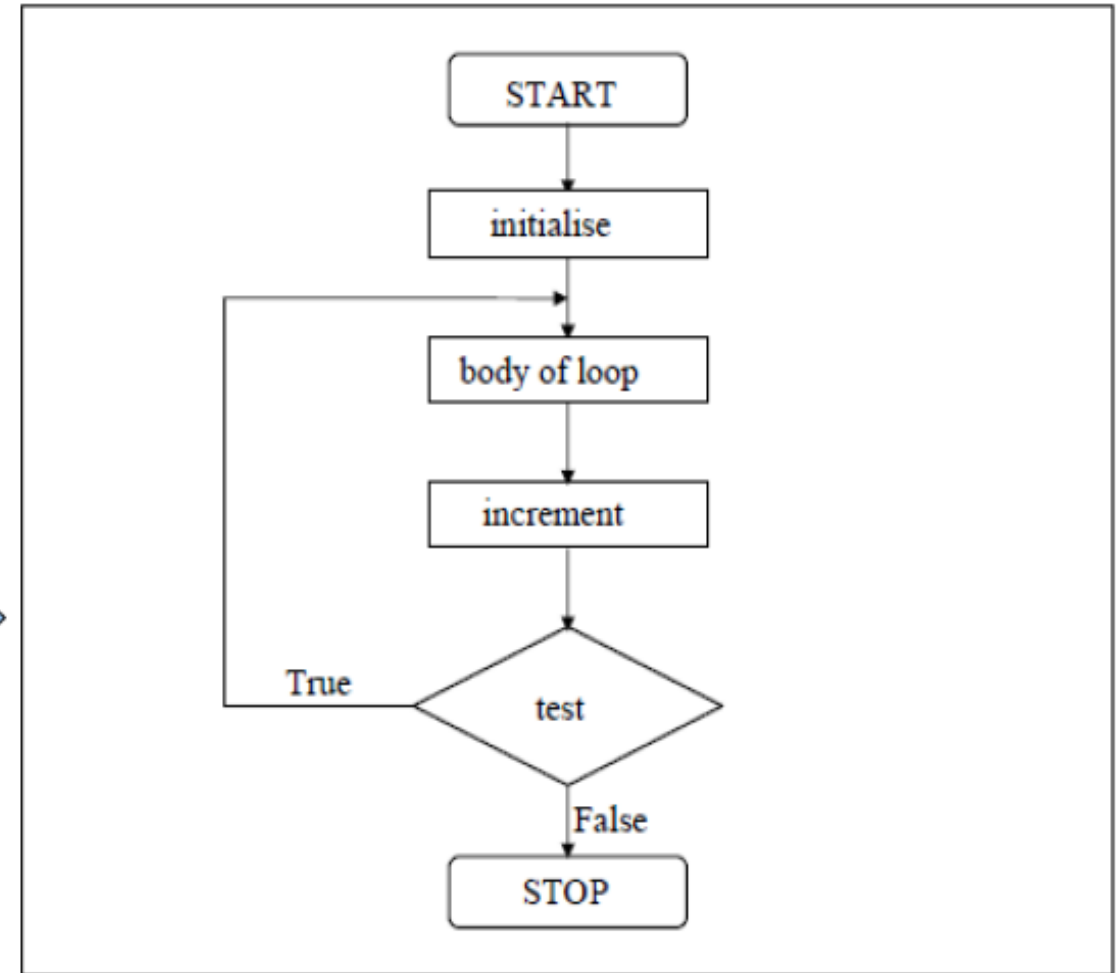

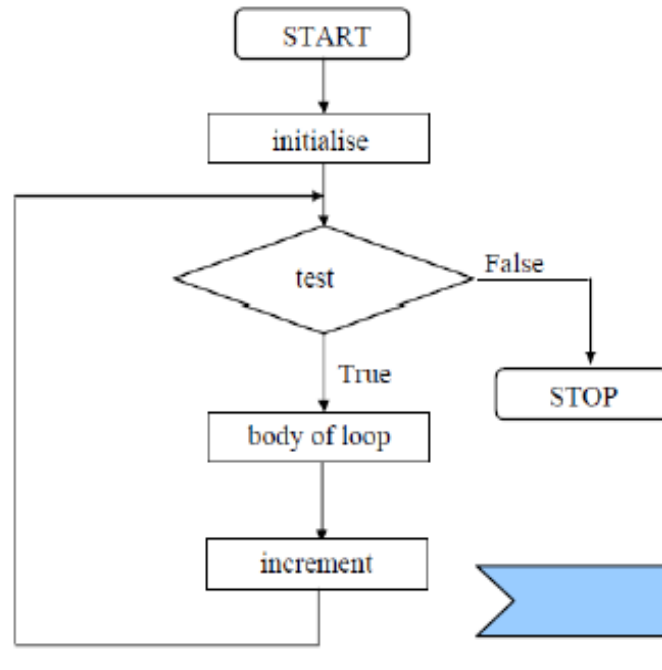

## CONTROL STRUCTURES IN C

# WHILE VERSUS DO-WHILE

## CONTROL STRUCTURES IN C

# DO-WHILE: EXAMPLE

## CONTROL STRUCTURES IN C

```
#include <stdio.h>
```

```
int main ()  
{
```

```
    /* local variable definition */
```

```
    int y = 1;
```

```
    /* do loop execution */
```

```
    do
```

```
    {
```

```
        printf("The value of y: %d\n", y);
```

```
        y = y + 1;
```

```
    }while( y < 15 );
```

```
    return 0;
```

```
}
```
