# CIS 1101 – PROGRAMMING 1

## ALGORITHM: PSEUDOCODE

# WHAT IS AN ALGORITHM?

---

A step-by-step procedure for **solving a problem** especially in **mathematics or computing** in a **limited** number of steps.

UNIVERSITY  
of SAN CARLOS  
SCIENTIA • VIRTUS • DEVOTIO

DCISM  
DEPARTMENT OF COMPUTER, INFORMATION SCIENCES AND MATHEMATICS

# ALGORITHM: IMPORTANT NOTES

- ❖ It has a definite beginning and a definite end.
- ❖ It has a finite number of steps.
- ❖ The instructions for each step are precise.
- ❖ Many algorithms involve repeating the same steps several times and can be carried out by a computer.
- ❖ Used for data processing, calculation and other related computer and mathematical operations.
- ❖ Used to manipulate data in various ways, such as inserting a new data item, searching for a particular item or sorting an item.
- ❖ The word “**algorithm**” comes from the name of a Persian mathematician called Al-Khwarizmi (Persian, 780-850).

# REPRESENTATIONS OF ALGORITHM

---

**1. Pseudocode**

**2. Flowchart**

**3. Program**

UNIVERSITY

# REPRESENTATIONS OF ALGORITHM: PSEUDOCODE

---

- A step-by-step instructions written in English-like statements.
- An artificial and informal language that helps to develop algorithms.

# REPRESENTATIONS OF ALGORITHM: **PSEUDOCODE**

- ❖ It is **useful** for **developing algorithms**
  - **that will be converted to programs**
- ❖ A **convenient** and **user-friendly language**
  - **not** an actual computer programming language

# PSEUDOCODE: IMPORTANT NOTES

- ❑ Pseudocode programs are **not executed on computers**.
- ❑ They merely help one “**thinks out**” a program before attempting to write it in a programming language such as C.
- ❑ Pseudocode **consists only of action statements** (those that are executed when the program has been converted from pseudocode to C and is run in C).

# 3 TYPES OF STATEMENTS

## 1. Composition/Sequential

- Sequence of statements are executed in order of appearance
- **Example:** Finding Average of 5 Numbers Problem

## 2. Alternation/Conditional

- Two or more sequences of statements may form alternatives so that **only 1** of the alternatives is executed. Use *if-then* or *if-then-else* keywords.
- **Example:** Determining Positive or Negative Number Problem

## 3. Iteration

- A sequence of statements may be executed repeatedly, zero or more times (zero meaning execution may be omitted altogether). Use *while* keyword.
- **Example:** Displaying numbers from 1 to 10

# USING MATHEMATICAL OPERATORS

**Purpose:** For clarity and precision

UNIVERSITY

DCISM  
DEPARTMENT OF COMPUTER, INFORMATION SCIENCES AND MATHEMATICS

# BASIC OPERATIONS AND SYMBOLS

- 1. Addition:** plus ( + )
- 2. Subtraction:** dash or hyphen ( - )
- 3. Multiplication:** asterisk ( \* )
- 4. Division:** slash ( / )
- 5. Modulo:** per cent ( % )
  - Remainder of a Division operation
  - Examples:
    - $5 \% 2 = 1$
    - $8 \% 3 = 2$
    - $5 \% 8 = 5$

# ASSIGNMENT AND RELATIONAL OPERATIONS

1. **Assignment:** equal symbol ( = )

2. **Relational Operators:**

- used to **compare numbers** and is either **1 (TRUE)** or **0 (FALSE)**

a) Less than: <

b) Greater than: >

c) Equality: ==

d) Not equal: !=

e) Less than or equal to: <=

f) Greater than or equal to: >=

**Note:** See the difference between = and ==

# LOGICAL OPERATORS

| Logical Operator | Name        | Description   |
|------------------|-------------|---|
| &&               | logical AND | It returns true when both conditions are true   |
|                  | logical OR  | It returns true when at-least one of the condition is true  |
| !                | logical NOT | It is used to reverse state of its operand. If a condition is true, then Logical NOT operator will make it false. |

# LOGICAL OPERATORS

TRUTH TABLE

| A     | B     | (A and B) | (A or B) | not(A and B) | not(A or B) |
|-------|-------|-----------|----------|--------------|-------------|
| True  | True  | True      | True     | False        | False       |
| True  | False | False     | True     | True         | False       |
| False | True  | False     | True     | True         | False       |
| False | False | False     | False    | True         | True        |

# LOGICAL OPERATORS

>>> (8>9) && (2<9)

False

>>> (2>1) && (2>9)

False

>>> (2==2) || (9<20)

True

>>> (3!=3) || (9>20)

False

>>> ! (8 > 2)

False

>>> ! (2 > 10)

True

# TYPES OF DIVISION

## 1) Integer Division:

- **Integers** are numbers with no fractional component
- **Operands** and **quotient** are integers
- Examples:
  - $5 / 2 = 2$
  - $6 / 2 = 3$
  - $2 / 5 = 0$

# TYPES OF DIVISION

## 2) Floating-point Division:

- **Float** numbers have fractional numbers
- **Operands** and **quotient** are floating numbers
- examples:
  - $5.0 / 2.0 = 2.5$
  - $6.0 / 2.0 = 3.0$
  - $2.0 / 5.0 = 0.4$

# WHAT IS A VARIABLE?

- A **storage location**
- paired with an **associated symbolic name**,
- which **contains some known or unknown quantity of information**
- referred to as a **value**.

□ **Holder of values**
